Jay Goyani - 202201163

The code below is part of a method in the ConvexHull class in the VMAP system. The following is a small fragment of a method in the ConvexHull class. For the purposes of this exercise, you do not need to know the intended function of the method. The parameter p is a Vector of Point objects, p.size() is the size of the vector p, (p.get(i)).x is the x component of the ith point appearing in p, similarly for (p.get(i)).y. This exercise is concerned with structural testing of code, so the focus is on creating test sets that satisfy some particular coverage criteria.

```
Vector doGraham(Vector p) {

    int i, j, min, M;

    Point t;

    min = 0;

    // Search for minimum y-coordinate

    for (i = 1; i < p.size(); ++i) {

        if (((Point) p.get(i)).y < ((Point) p.get(min)).y) {

            min = i;

        }

    }

   // Continue along values with the same y component

    for (i = 0; i < p.size(); ++i) {

        if ((((Point) p.get(i)).y == ((Point) p.get(min)).y) &&

            (((Point) p.get(i)).x > ((Point) p.get(min)).x)) {

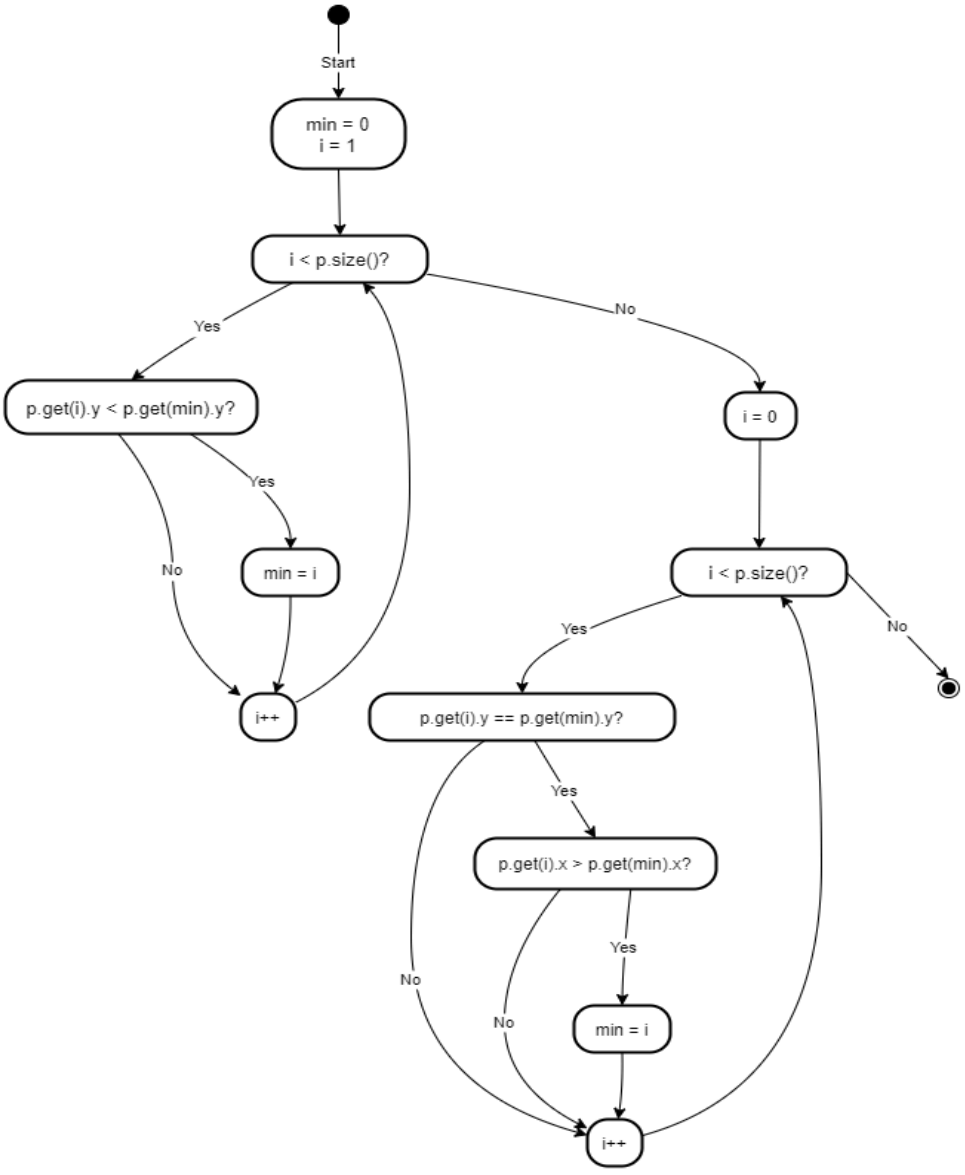
            min = i;

        }

    }

}
```

Task 1. Convert the code comprising the beginning of the doGraham method into a control flow graph (CFG). You are free to write the code in any programming language.



Task 2: Construct test sets for your flow graph that are adequate for the following criteria:

a. Statement Coverage:

- **TC1**: `p = [(2, 8), (3, 4), (7, 2)]`
  Covers cases where `p.get(i).y < p.get(min).y` is true.
- **TC2**: `p = [(2, 2), (3, 2), (5, 2), (6, 2)]`
  Covers cases where `p.get(i).y == p.get(min).y` and `p.get(i).x > p.get(min).x`.

b. Branch Coverage:

- **TC3**: `p = [(3, 4), (6, 6), (7, 10), (11, 16)]`
  Covers the false branch for the condition `p.get(i).y < p.get(min).y`.
- **TC3 (Revised)**: `p = [(11, 16), (7, 10), (6, 6), (3, 4)]`
  Covers the true branch for the condition `p.get(i).y < p.get(min).y`.
- **TC4**: `p = [(2, 2), (4, 2), (5, 2)]`
  Covers both true and false branches of `p.get(i).y == p.get(min).y` and `p.get(i).x > p.get(min).x`.

c. Basic Condition Coverage:

- **TC5**: `p = [(3, 5), (5, 6)]`
  Covers `p.get(i).y < p.get(min).y` as false.
- **TC6**: `p = [(4, 7), (4, 5)]`
  Covers `p.get(i).y < p.get(min).y` as true.
- **TC7**: `p = [(2, 3), (4, 3)]`
  Covers `p.get(i).y == p.get(min).y` as true and `p.get(i).x > p.get(min).x` as true.
- **TC8**: `p = [(1, 1), (2, 2)]`
  Covers `p.get(i).y == p.get(min).y` as false and `p.get(i).x > p.get(min).x` as false.

Task 3: For the test set you have just checked can you find a mutation of the code (i.e. the deletion, change or insertion of some code) that will result in failure but is not detected by your test set. You have to use the mutation testing tool.

```
[*] Start mutation process:
   - targets: point
   - tests: test_points
[*] 4 tests passed:
   - test_points [0.36220 s]
[*] Start mutants generation and execution:
   - [#   1] COI point:

   - timeout: 0 (0.0%)
```

1. Deletion Mutation:

Remove `min = i` in the first `if` condition.

Mutation Code:

```
// Remove this line: min = i; if (((Point)
p.get(i)).y < ((Point) p.get(min)).y) {
   // min = i; <- this line is removed

}
```

2. Insertion Mutation:

Add `min = 0` at the beginning of the second loop

Mutation Code:

```
   for(i = 0; i < p.size(); ++i) { min = 0; //
      Inserted line if (((Point) p.get(i)).y ==
      ((Point) p.get(min)).y &&
       ((Point) p.get(i)).x < ((Point) p.get(min)).x) {
       min = i;

   }

}
```

3. Modification Mutation:

Change `p[i].y < p[min].y` to `p[i].y > p[min].y` in the first `if` condition.

Mutation Code:

```
   if (((Point) p.get(i)).y > ((Point) p.get(min)).y) { // Modified from
      < to > min = i;
}
```

Task 4: Create a test set that satisfies the path coverage criterion where every loop is explored at least zero, one or two times.

```
import unittest

from point import Point, find_min_point

class TestFindMinPointPathCoverage(unittest.TestCase):

    def test_no_points(self):

        points = []

        with self.assertRaises(IndexError):  # Expect an IndexError due to
empty list

            find_min_point(points)
```

```
    def test_single_point(self):
        points = [Point(5, 5)]
        result = find_min_point(points)
        self.assertEqual(result, points[0])  # Expect the point (5, 5)

    def test_two_points_unique_min(self):
        points = [Point(2, 8), Point(3, 9)]
        result = find_min_point(points)
        self.assertEqual(result, points[0])  # Expect the point (2, 8)

    def test_multiple_points_unique_min(self):
        points = [Point(6, 7), Point(3, 6), Point(4, 2)]
        result = find_min_point(points)
        self.assertEqual(result, points[2])  # Expect the point (4, 2)

    def test_multiple_points_same_y(self):
        points = [Point(5, 3), Point(6, 3), Point(4, 3)]
        result = find_min_point(points)
        self.assertEqual(result, points[1])  # Expect the point (6, 3)

    def test_multiple_points_minimum_y_ties(self):
        points = [Point(8, 4), Point(5, 4), Point(7, 1), Point(9, 1)]
        result = find_min_point(points)
        self.assertEqual(result, points[3])  # Expect the point (9, 1)
```

```
if __name__ == "__main__":

    unittest.main()
```

Lab Execution:

Q1) After generating the control flow graph, check whether your CFG matches with the CFG generated by Control Flow Graph Factory Tool and Eclipse flow graph generator.

Ans. Control Flow Graph Factory :- YES

Eclipse flow graph generator :- YES

Q2) Devise minimum number of test cases required to cover the code using the aforementioned criteria.

1. Statement Coverage: 3 test cases
2. Branch Coverage: 3 test cases
3. Basic Condition Coverage: 2 test cases
4. Path Coverage: 3 test cases

Summary of Minimum Test Cases:

● Total: 3 (Statement) + 3 (Branch) + 2 (Basic Condition) + 3 (Path) = 11 test cases

Q3) and **Q4)** Same as Part 1 which is done above
